

HCL

1. Write a Python program which accepts a sequence of comma separated 4 digit binary numbers as its input and then check whether they are divisible by 5 or not. The numbers that are divisible by 5 are to be printed in a comma separated sequence. Example: 0100,0011,1010,1001 Then the output should be: 1010

```
ans=input().split(",")
for i in ans:
    binary=i.strip()
    if(int(binary,2)%5==0):
        print(binary)
```

output:

The screenshot shows a code editor with a file named 'main.py'. The code is as follows:

```
1 ans=input().split(",")
2 for i in ans:
3     binary=i.strip()
4     if(int(binary,2)%5==0):
5         print(binary)
6
```

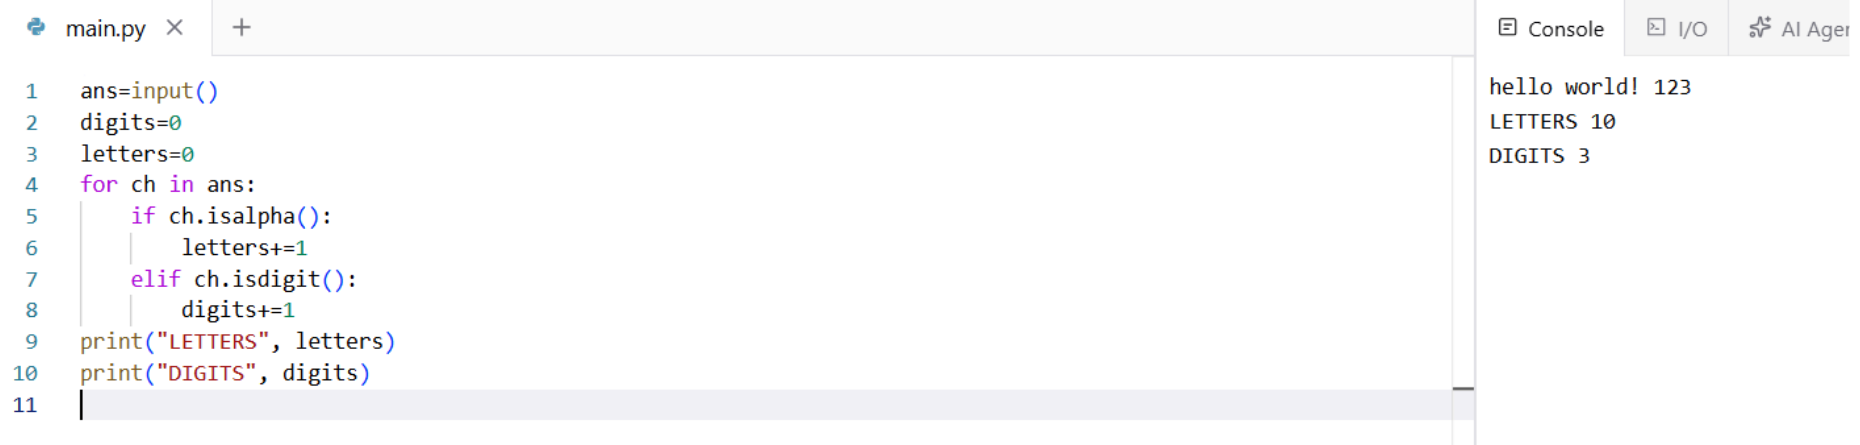

On the right side, there are tabs for 'Console', 'I/O', and 'AI Agent'. The 'Console' tab is active, showing the output of the program:

```
1010,0100,1001,1010
1010
1010
```

2. Write a Python program that accepts a sentence and calculate the number of letters and digits. Suppose the following input is supplied to the program: hello world! 123 Then, the output should be: LETTERS 10 DIGITS 3

```
ans=input()
digits=0
letters=0
for ch in ans:
    if ch.isalpha():
        letters+=1
    elif ch.isdigit():
        digits+=1
print("LETTERS", letters)
print("DIGITS", digits)
```

output:

The screenshot shows a code editor with a file named 'main.py'. The code is a Python program that takes a string input and counts the number of letters and digits. The output is displayed in a console window on the right.

```
1 ans=input()
2 digits=0
3 letters=0
4 for ch in ans:
5     if ch.isalpha():
6         letters+=1
7     elif ch.isdigit():
8         digits+=1
9 print("LETTERS", letters)
10 print("DIGITS", digits)
11
```

Console Output:

```
hello world! 123
LETTERS 10
DIGITS 3
```

3. Write a program which can compute the factorial of a given numbers. The results should be printed in a comma-separated sequence on a single line. Suppose the following input is supplied to the program: 8 Then, the output should be: 40320

```
n=int(input())
fact=1
for i in range(1,n+1):
    fact=fact*i
print(fact)
```

output:

```
n=int(input())  
fact=1  
for i in range(1,n+1):
```

8
40320
